

SPECIALIST / BESPOKE JOINERY PROJECTS

Because timber has more uses in modern construction than ever before, many of today's projects demand input from contractors with very particular expertise.

As a specialist joinery contractor we can share the benefits of our long experience with the architect and with the client, helping them to develop an idea from conception to final, successful installation on site.

Our expertise in many projects has ensured that visionary designs have been brought to life. Typical works include hardwood external cladding or decking, internal timber staircases, reception counters and ornate bars.

We can source many types of timber and offer a full range of ancillary services.

Case Study: Trinity Park Conference Centre

This highly unusual design, built almost entirely of timber, called on all the specialist skills and experience that M & S have to offer. Designed to be one of Suffolk's landmark buildings, at a cost of £3.2 million, the Trinity Park Conference Centre uses massive moveable timber partitions to create a uniquely flexible space.

The façade of the building was built around a basic steel structure and consists of a timber frame with larch cladding. The roof area (right) is supported by a massive Glulam beam structure. In between these beams we fitted timber purlins and rafters and a slatted timber ceiling. All the timber was coated with a fire retardant treatment before installation.

Design and project management for the installation was a major enterprise because of the vast amounts of timber and setting out it demanded, and the need to work closely with other trades on site. It demonstrates that M & S can provide design solutions and advice for major projects involving bespoke timber design, which demand large resources and the experience to deliver on time and within budget.
